KMC CONTROLS

Operating system compatibility

Issued 27 May 2010 Revision A

As part of our continuing development of software products, KMC Controls is working toward changing our major software applications to run on Microsoft Windows 7. Before we make recommendations or release new versions, we will test our applications for compatibility with the new operating system. As new versions become available, we will make announcements on our web site and send announcements to our partner organizations. As always, automatic e-mail notifications will be sent to subscribers as new versions of applications are posted to the KMC Controls web site. Until then, we continue to support our software products for the operating systems listed in our published specifications.

> **Note:** Only WinControl XL Plus will run on a 64-bit operating system. All others require a 32-bit operating system.

> **Note**: When running on a computer with a 64-bit processer, regardless of the operating system, BACstage cannot connect to an internetwork with BACnet 8802.3. Connecting to an internetwork with BACnet IP or BACnet MS/TP is functional.
